Assignment 2
Course “New Generation Data Models and DBMSs”

Take into account the conceptual model that you have identified in the first assignment and consider the following workload:

1. Identify the top 5 most competitive campaigns, i.e., those that received the highest number of pledges.
2. For each campaign creator, identify the category in which they achieved the highest average pledge amount.
3. For each month in the last year, identify the top 10 creators per month, i.e., the creators who completed the highest number of successful campaigns in that month.

Develop the following points:

1. By considering the MongoDB data model, provide the logical model that is most adequate in answering the previous queries. Provide a diagram showing how the collections can be organized, and the references among collections.
2. Discuss the occurrence of redundancies in the proposed solution and the effects of your design in the execution time of the proposed operations (show how many operations need to be executed to answer the queries in the workload).
3. Identify the possibility to apply patterns to improve the performances of the proposed operations.
